Flat Chef

Process and Site Evaluation.

Within the process of creating the website flat chef i came across multiple road blocks with jQuery functions. Most of these were resolved such a parallax effect. As well as click to toggle elements, more specifically problems arose when trying to implement these functions across multiple elements. Though despite my attempts at using the accelerometer plugins with the iPhone, the tilt to scroll event never seemed to work.

I used bootstrap in order to use their 12-column row framework, though encountered problems with the responsive nature the site, this lead me to invest additional ways to smooth problems had with responsiveness these being media queries. I found them to be very helpful and efficient especially as we were designing for 3 devices. In terms of the layout and presentation of the site i focused on the experience of telling a story, inviting the user in with a jazzy parallax effect setting the tone of the website, where i think began to explain the site and what you may find within it. It then goes on to look through identity of different chefs within the "Residential Restaurant" flat. and finally gives some information to round the site off, with some meal ideas with Jquery functions that work on all selected platforms.

It is designed for mainly portrait view on iPad and iPhone though landscape view was considered and it works seamlessly across these platforms.
